

1、KR & Ontology

Logic-based ontology, specified in formal logic languages, which are decidable and reasonable, share a common understanding of the information between human and agent. The knowledge can be represented by limited words and meanwhile reasoned in formal logic syntax. If we interpret the domain and concepts as a set and elements in the set, we can compute the KR model with set theory in semantics. It is so computational that we can interpret the logic words and write programs for computers to analyze and process.

2、Expressivity & Computability

My sentence: "Where are you from?"

This question is unable to be modelled in the formal languages.

Disagree:

If a logic-based KR language is designed as expressive as possible, it will lose so many useful properties such as decidability, soundness and completeness and result in too complex structure. On the other hand, natural language should be as expressive as possible in any circumstances for the reason that it is not a computational model and should always be the most expressive one as the main communication method.

3、Manchester Syntax

(1) Timo is a cow has livestocked by Tom.

Timo is an animal.

(2) No, Fido must be a sheep.

(3) No, just owning is not enough.

(4) None

4、SHOIQ&FOL

(1)

1.

$\forall Couple. Chinese \sqcap \leq 3 has_child. \top$

- concept name: Couple
- role name: has_child

role后必跟. \top

2.

$\{ML\} \sqsubseteq Course \sqcap \exists taught_by. \{SFM\}$

$\{SFM\} \sqsubseteq professor \sqcap \exists work_at. \{NJU\}$

- concept name: Course, professor
- role name: taught_by, work_at
- nominals: {ML}, {SFM}, {NJU}

3.

$\{NJU\} \sqsubseteq university \sqcap \exists contain_member. \{school, department\}$

- concept name: university
- role name: contain_member
- nominals: {school, department}, {NJU}

2选1有其他表示方法?

4.

$\{NJU\} \sqcap \geq 30000 has_student. Student$

- concept name: Student
- role name: has_student
- nominals: {NJU}
- role后必跟

5.

$\forall member_of. AI_School \sqsubseteq \{undergraduate, graduate, teacher\}$

- concept name: AI_School, undergraduate, graduate, teacher
- role name: member_of

6.

$\|citizenOf\| \sqsubseteq relation$

$\|citizenOf\|. domain \sqcap consist_of. countries$

- concept name: "citizenOf", relation
- role name: consist_of

(2)

5.

$\forall x (membersOf(x, AI_school) \longrightarrow (undergraduates(x) \vee graduates(x) \vee teachers(x)))$

6.

$\exists relation ((relation \approx \|citizenOf\|) \wedge (countries \sqsubseteq domain_of_relation))$

5、DL Semantics

1.True

when $\mathcal{O} \models \top \sqsubseteq \perp$

2.False

Assume that an ontology has only finite models, we can always replace any current element in its $\Delta^{\mathcal{I}}$ with any new element which hasn't exist in all current finite models. It's practical because new element is always infinite.

3.True

According to the proof of (1) and the disapprove of (2)

4.true

Proof from definition: Class C is satisfiable with respect to \mathcal{T} if there exists a model \mathcal{I} of \mathcal{T} and some $d \in \Delta^{\mathcal{I}}$ with $d \in C^{\mathcal{I}}$;

5.false

If there is an unsatisfiable class have a non-empty interpretation in some model, it also satisfy the definition of satisfiable class, which conflicts to its original statement.

6.True

From the disapprove of (5), we know an unsatisfiable class is actually \emptyset , then it will be a subclass of any other class.

6、 Interpretation as Graph

$$\Delta^I = \{d, e, f, g, h, i\}$$

$$A^I = \{d, e, g\} \quad C^I = \{h\} \quad D^I = \{g, i\}$$

$$r^I = \{(d, e), (e, f), (f, g)\} \quad s^I = \{(d, d), (e, d), (d, f), (d, h), (h, i)\}$$

p.s.把B当作空

$$1. \neg A = \{f, h, i\}$$

$$2. \exists r. (A \sqcup B) = \{d, f\}$$

$$3. \exists s. \neg A = \{d, h\} \quad \exists s. \exists s. \neg A = \{d, e\}$$

$$4. \neg A \sqcap \neg B = \{f, h, i\}$$

$$5. \forall r. (A \sqcup B) = \{d, f, g, h, i\} \text{ 不必一定在A中}$$

$$6. \leq 1s. \top = \{e, h, f, g, i\} \text{ 记得包括0}$$

7、 DL Semantics

(1)

$$1. (Q \sqcap \geq 2r. P)^I = \emptyset$$

$$2. (\forall r. Q)^I = \{b, c, d, e\}$$

$$3. (\neg \exists r. Q)^I = \{b, c, e\}$$

$$4. (\forall r. \top \sqcap \exists r^-. P)^I = \{b, d, e\}$$

$$5. (\exists r^-. \perp)^I = \emptyset$$

(2)

$$1. A \sqcap B = \emptyset$$

$$2. \exists r. B = \{1, 2\}$$

$$3. \exists r. (A \sqcap B) = \emptyset$$

$$4. \top = \{1, 2, 3, 4, 5, 6\}$$

$$5. A \sqcap \exists r. B = \{1, 2\}$$

6.True

7.True

8.True

9.False

10.False

8、 DL Semantics

(1)True

\forall "a" in $\exists r. C$, there must exist some b that satisfies (a,b) in r and b in C.

According to $C \sqsubseteq D$, b must be in D, then we get "a" in $\exists r. D$ which means $\exists r. C \sqsubseteq \exists r. D$

(2)False

Counter example:

$$\begin{aligned}\top &= \{a, b, c\} \\ r &= \{(a, b), (a, c)\} \\ C &= \{a, b, c\}\end{aligned}$$

Then we have:

$$\exists r. C = \{a\} \leq 1r. \top = \emptyset$$

(3)True

Both are $\{x \in \Delta^{\mathcal{I}} \mid \text{forall } y \in \Delta^{\mathcal{I}} \text{ there is no } (x, y) \in r^{\mathcal{I}}\}$

(4)False

Counter example:

$$\begin{aligned}\top &= \{a, b, c, d\} \\ r &= \{(a, b), (a, c)\} \\ A &= \{a, b\} \\ B &= \{c, d\}\end{aligned}$$

Then we have:

$$\begin{aligned}\forall r. (A \sqcup B) &= \{a, b, c, d\} \\ \forall r. B &= \{b, c, d\} \\ \forall r. A &= \{b, c, d\} \\ (\forall r. B) \sqcup (\forall r. A) &= \{b, c, d\}\end{aligned}$$

(5)True

$\forall a$ in $\exists r. (A \sqcup B)$, there must exist (a,b) in r that satisfies b in A or B, which means a in $\exists r. A$ or in $\exists r. B$. Then we find a in $(\exists r. B) \sqcup (\exists r. A)$

$\forall c$ in $\exists r. A$ or in $\exists r. B$, there must exist (c,d) in r that satisfies d in A or B, which means c in $\exists r. (A \sqcup B)$

9、DL Semantics

Let interpretation \mathcal{I} be defined by

$$\begin{aligned} Person &= \{a, b, c\} \\ hasChild &= \{(a, c), (b, c)\} \\ Parent &= \{a, b\} \\ Mother &= \{b\} \end{aligned}$$

So, $\mathcal{I} \models \text{Parent} \sqsubseteq \text{Mother}$

10、DL Semantics

(1)

\Rightarrow :

If we have $X \sqsubseteq_{\mathcal{T}} Y$, then $X \sqcap \neg Y = \emptyset$ is not satisfiable

\Leftarrow :

If we have $X \sqcap \neg Y$ is not satisfiable, then it must be \emptyset . So we have $X \sqsubseteq_{\mathcal{T}} Y$

(2)

\Rightarrow :

If we have X is satisfiable, then $X \neq \emptyset$ and $X \not\sqsubseteq \perp$.

\Leftarrow :

If we have $X \not\sqsubseteq \perp$, then X must be \emptyset . So X is satisfiable.

11、Bisimulation

(1) induction proof:

1. conjunction:

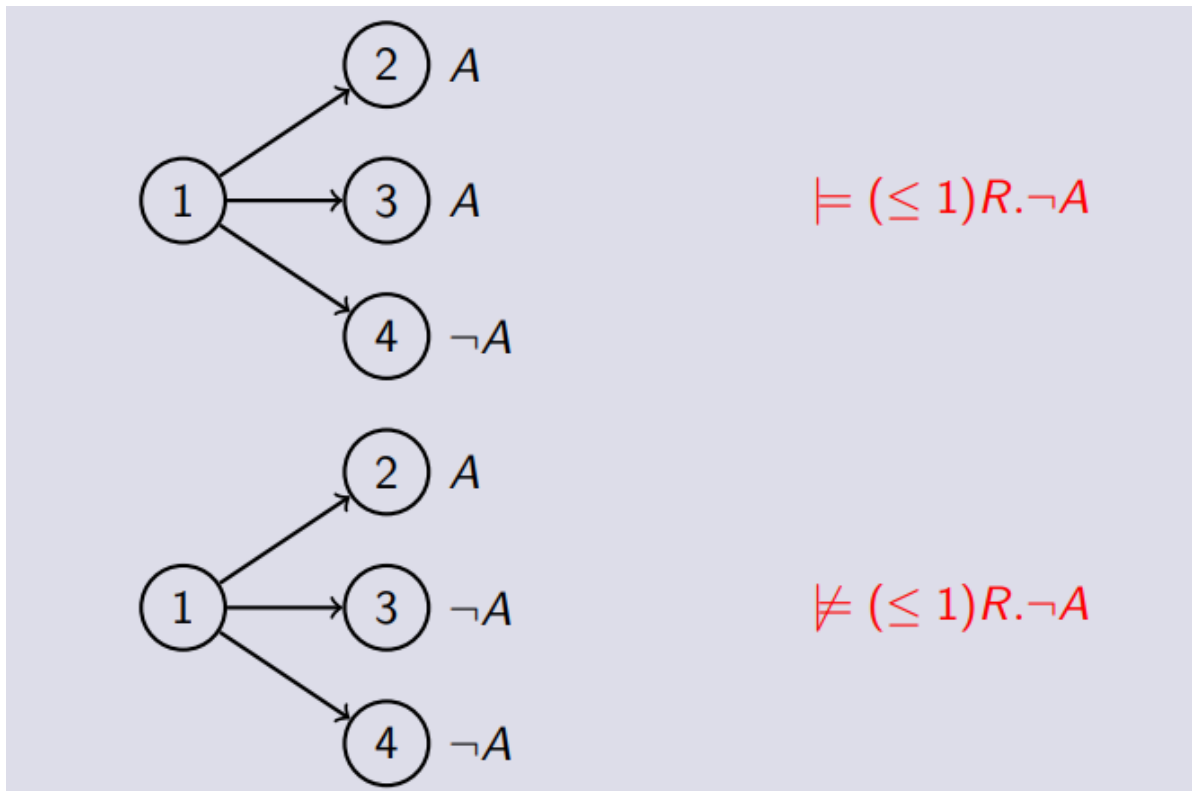

2. negation:

If $C = \neg D$, then $d_1 \in C^{I_1}$ if and only if $d_1 \notin D^{I_1}$
if and only if $d_1 \in \Delta^{I_1} - D^{I_1}$
if and only if $d_2 \in \Delta^{I_2} - D^{I_2}$
if and only if $d_2 \in C^{I_2}$

3. existential quantification:

If $C = \exists r. D$, then $d_1 \in C^{I_1}$ implies the existence of $d'_1 \in D^{I_1}$ such that $(d_1, d'_1) \in r^{I_1}$,
which implies the existence of $d'_2 \in D^{I_2}$ such that $(d_2, d'_2) \in r^{I_2}$.
So we have $d_2 \in C^{I_2}$

(2)ALCQ

We show that in ALCQ we can distinguish two models which are not distinguishable in ALC. \mathcal{ALCQ} concept C is more expressive than any \mathcal{ALC} concept D

(2)S

e.g.

$$\top = \{a, b, c, d\}$$
$$r = \{(a, b), (b, c)\}$$

Then $\mathcal{I} \not\models \text{transitive}(r)$ but $\mathcal{I} \models r$, which means \mathcal{S} is more expressive than \mathcal{ALC}

12、Protege

(1)

axiom count:801

logical axiom count:322

They are different because axiom consists of many kinds such as declaration axiom, annotation assertions and logical axiom. Many axioms are not logical.

(2)

use nominals:

- Country is EquivalentTo DomainThing and ({ America, England, France, Germany, Italy })

use negations:

- VegetarianPizza EquivalentTo Pizza and (not (hasTopping some SeafoodTopping)) and (not (hasTopping some MeatTopping))
- NonVegetarianPizza EquivalentTo Pizza and (not VegetarianPizza)

declare a sub-property of an object property:

- hasTopping SubPropertyOf: hasIngredient

declare an inverse property:

- hasBase InverseOf isBaseOf

(3)

The screenshot displays the Protégé OWL editor interface. The 'Reasoner' menu is open, showing options: 'Start reasoner', 'Synchronize', 'Stop reasoner', 'Explain inconsistent ontology', 'Configure...', and a list of reasoners including 'HermiT 1.4.3.456' and 'None'. A tooltip for 'Start reasoner' explains that the reasoner is already running but hasn't taken recent changes into account, suggesting synchronization. The left pane shows the class hierarchy with 'IceCream' selected under 'Pizza'. The right pane shows the 'IceCream' class description, including its label, comment, and various axioms: 'Equivalent To' (owl:Nothing), 'SubClass Of' (hasTopping some FruitTopping and Pizza), 'General class axioms', 'SubClass Of (Anonymous Ancestor)' (hasBase some PizzaBase), 'Instances', 'Target for Key', 'Disjoint With' (PizzaTopping, Pizza, PizzaBase), and 'Disjoint Union Of'.

Because IceCream is equivalent to Nothing and there is a restriction "SubClassOf hasTopping some FruitTopping" on this class. However, the property hasTopping has a domain of Pizza. As we can see in the picture, Ice cream is disjoint with pizza. So these 2 contradictory restrictions result in its color turning red.

(4)

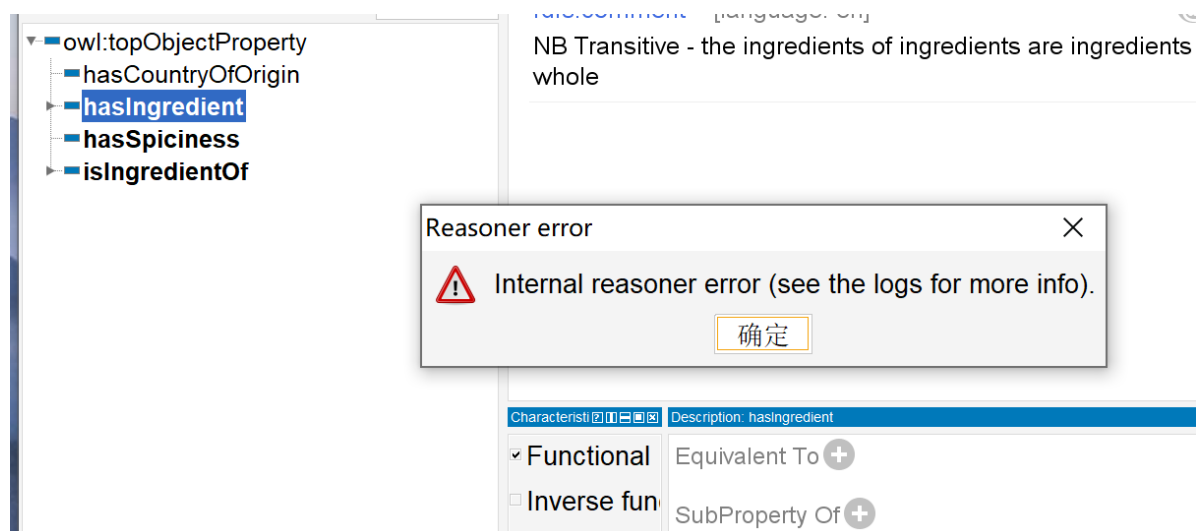

The inferred superclass for class "CajunSpiceTopping" is "SpicyTopping".

The inferred superclass for class "SloppyGiuseppe" is "CheesyPizza", "InterestingPizza", "MeatyPizza", "SpicyPizza" and "SpicyPizzaEquivalent". (yellow part in the picture)

(5)

First we tick the "function" button and then synchronize the reasoner, the result is as followed in the picture.

The object property "hasIngredient" it not functional as a result of every food can have various ingredient.

13、 First Protege

classes

Most information is gotten in the schedule table given in the assignment.zip.

Add disjoint set for each subclasses.
